This conference examines a paradox: urban sustainability initiatives that are so vital in countering climate change can, through their improvements, contribute to driving up rents and driving out residents, and in the process, exacerbate sprawl, greenhouse gas emissions, and climate change itself. Our speakers examine the growing link between environmental improvement and social displacement and ask: How is it possible to break this link? What would it mean to include affordable housing and equity within sustainability efforts? And what are the consequences—socially and ecologically—if we don't?
